

1. Given below are two statements →

(Mains - 2021, July 27th,
shift 1)

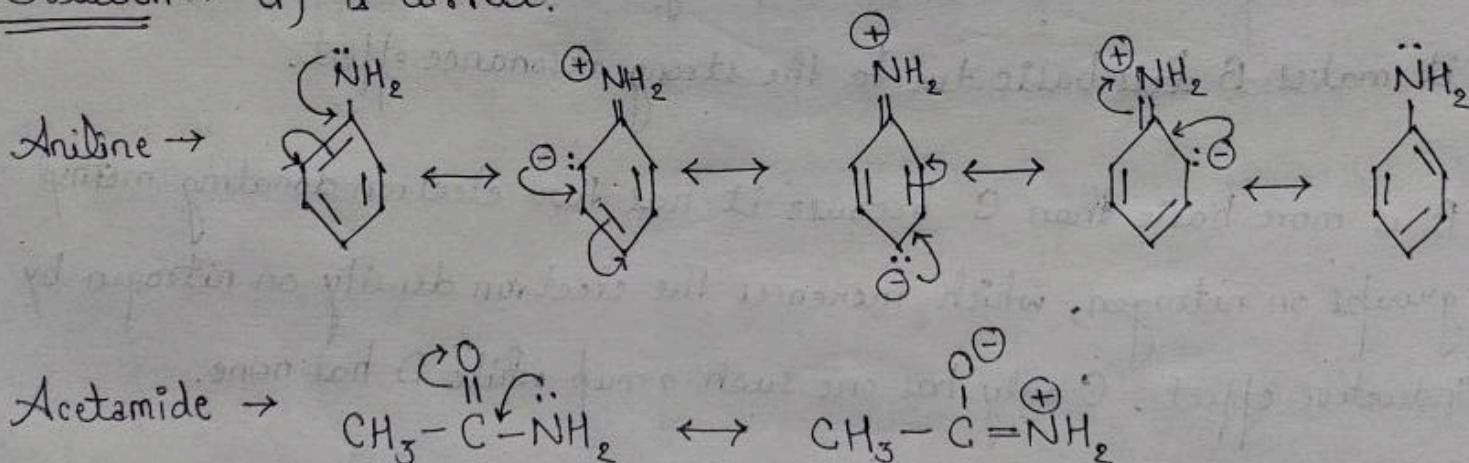

Statement I: Aniline is less basic than acetamide.

Statement II: In aniline, the lone pair of electrons on nitrogen atom is delocalized over benzene ring due to resonance and hence less available to a proton.

Choose the correct option.

- a) Statement I is true but statement II is false.
- b) Both statement I and II are true.
- c) Both statement I and II are false.
- d) Statement I is false but statement II is true.

Solution → d) is correct.

Even though aniline has more resonating structures and should be more stable and less basic, oxygen is more electronegative and a much better withdrawing group than the phenyl group.
