

Tips for Polymers

- This is a topic that is conceptually very similar to the rest of organic chemistry
- It's a low hanging fruit and one can easily prepare it in one day(maximum). Thus, it is highly recommended that you don't leave it and spend that time on this.
- Keep in mind the common name of the monomers and polymers.
- The various sub-sections of the topic can be revised through the video sections provided under "Concept wise videos"
- It is highly recommended that one tries to imagine the various reactions rather than memorizing them individually. This can be done by imagining the structures and keeping in mind the mechanisms which can be found in other topics of organic chemistry. However, there is no guaranteed method to effectively learn organic chemistry other than thoroughly working out the mechanisms.
- Mechanisms and a good understanding of bonding hold the key to organic chemistry and thus Polymers.
