

QUES 03:-

Five long wires A, B, C, D and E, each carrying current I are arranged to form edges of a pentagonal prism as shown in Fig. Each carries current out of the plane of paper.

- What will be magnetic induction at a point on the axis O? AO is at a distance R from each wire.
- What will be the field if current in one of the wires (say A) is switched off?
- What if current in one of the wires (say A) is reversed?

Sol. a. Suppose the five wires A, B, C, D and E be perpendicular to the plane of paper at locations as shown in figure.

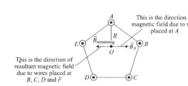

Thus, magnetic field induction due to five wires will be represented by various sides of closed pentagon in one order lying in the plane of paper. So, its value is zero.

b. If current in one of the wires (say A) is switched off, then current in wires B, C, D and E is equal and opposite to the magnetic field induction at O due to current through wire A, since, the vector sum of magnetic field produced by each wire at O is equal to 0. Therefore, resultant induction produced by one current carrying wire is equal magnitude of resultant of four wires acting in same direction.

$$\vec{B}_A + \vec{B}_{\text{remaining}} = 0$$

$$\frac{\mu_0 I}{2R} \hat{i} + \vec{B}_{\text{remaining}} = 0 \Rightarrow \vec{B}_{\text{remaining}} = -\frac{\mu_0 I}{2R} \hat{i}$$

Therefore, the field if current in one of the wires (say A) is switched off is $\frac{\mu_0 I}{2R}$ perpendicular to AO towards left.

This is the direction of resultant magnetic field due to wires A, B, C, D, and E at point O.

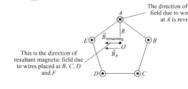

\vec{B}_A is the direction of magnetic field due to wire A.

\vec{B}_E is the direction of magnetic field due to wire E.

\vec{B}_D is the direction of magnetic field due to wire D.

\vec{B}_C is the direction of magnetic field due to wire C.

\vec{B}_B is the direction of magnetic field due to wire B.

If current in wire A is reversed, then Total magnetic field induction due to O.

= Magnetic field induction due to wire A + Magnetic field induction due to wires B, C, D, and E

$$= \frac{\mu_0 I}{2R} \hat{i} (\text{acting perpendicular to AO towards left}) + \frac{\mu_0 I}{2R} \hat{i} (\text{acting perpendicular AO towards left}) + \frac{\mu_0 I}{2R} \hat{i} (\text{acting perpendicular AO towards left})$$

Thus, the direction of resultant magnetic field due to wires A, B, C, D, and E at point O is $\frac{\mu_0 I}{2R} \hat{i}$ acting perpendicular AO towards right.

The direction of magnetic field due to wire A is reversed.

The direction of resultant magnetic field due to wires A, B, C, D, and E at point O is $\frac{\mu_0 I}{2R} \hat{i}$ acting perpendicular AO towards right.
