

**Q 5** A metal plate of area  $1 \times 10^{-4} \text{ m}^2$  is illuminated by a radiation of intensity  $16 \text{ mW/m}^2$ . The work function of the metal is  $5 \text{ eV}$ . The energy of the incident photons is  $10 \text{ eV}$  and only  $10\%$  of it produces photo electrons. The number of emitted photo electrons per second and their maximum energy, respectively, will be:

[ $1 \text{ eV} = 1.6 \times 10^{-19} \text{ J}$ ]

[Main 10 Jan. 2019 (II)]

- (a)  $10^{14}$  and  $10 \text{ eV}$       (b)  $10^{12}$  and  $5 \text{ eV}$   
(c)  $10^{11}$  and  $5 \text{ eV}$       (d)  $10^{10}$  and  $5 \text{ eV}$

**Ans** (c) using, intensity  $I = \frac{nE}{At}$

n = no. of photoelectrons

$$\Rightarrow 16 \times 10^{-3} = \left( \frac{n}{t} \right) \times \frac{10 \times 1.6 \times 10^{-19}}{10^{-4}} \text{ or, } \frac{n}{t} = 10^{12}$$

So, effective number of photoelectrons ejected per unit time =  $10^{12} \times 10/100 = 10^{11}$
